

## Greville House, Cheltenham

This sensitive residential development in a conservation area comprises 3 new apartments, 5 new mews houses, a large detached ‘gatehouse’ and the refurbishment of an historic building into luxury apartments.

Engineering considerations on the site included the diversion of a major public sewer. The buildings comprise loadbearing masonry structures supporting beam and block ground floors and TJI long-span timber upper floors. Feature steel and timber-decked balconies adorn the front mews elevation.

Structural alterations to the historic building included retaining and strengthening the original timber floors and the stabilisation of most of the loadbearing masonry walls and their foundations.

A sensitive residential development in a conservation area.

KB2 Consulting Civil & Structural Engineers

Providing engineering certainty by delivering intelligent designs, minimising project risk and applying principles of sustainability.
